Hi Rohan, Shivku,

Picking up on the "revenue system embedded in support" thread — here's where we landed after a design pass.

What it does. Every inbound support call and every new Salesforce Case carries the account's revenue tier (HYPERCARE / STRATEGIC / PREMIUM / STANDARD), so routing, priority, and screen pop become tier-aware with no agent lookup. Tiers derive from existing flags (`Hypercare_active__c` , `Top_Customer__c` , `Is_SAAS_Premium_Account__c` , `SAAS_Enterprise_Account__c` , `RAG__c`) — no new data entry.

Status. Salesforce side is built and sitting in the `claude/upbeat-ride` branch — tier formulas, Before-Save Flow, queue config (custom metadata), integration user + Connected App, Apex tests, plus a stateless Node middleware for the IVR round-trip.

What we need from PS — the telephony + CTI wiring:

1. IVR nodeflow — HTTP action node into the router, branch on `queue_name` .
2. Four Exotel queue destinations bound to the Salesforce queues.
3. Open CTI softphone update for the tier banner + screen pop.
4. Three blocking capability questions (auth scheme, latency budget, `call_sid` pass-through).

Ask. 15-min sync to walk the design and sequence the next steps. Suggested (IST) — grab whichever works, happy to flex:

- <Tue DD-MMM> 3:30 pm
- <Wed DD-MMM> 11:00 am
- <Thu DD-MMM> 4:00 pm

Full deployment plan, architecture, dependency matrix, and rollout guardrails attached.

Thanks, Shivanand

Optional follow-up (after first reply)

Thanks for the feedback. To unblock UAT we need:

- ☐ Confirmation of the Exotel HTTP action node auth scheme (header pass-through vs. token in body).

- ☐ Two test numbers we can dial into a staging IVR to verify the routing branch.
- ☐ Telephony-side lead time for the four queue destinations, so we can sequence the Salesforce deploy.

Once we have those, we can pencil in a UAT window for the following week.
