

Revenue System Embedded in Support

Initiative: Make the support workflow revenue-aware by surfacing Salesforce Account revenue context into ECC (Exotel Contact Center) for every customer interaction — calls and tickets — across all customers.

Status: Design phase. Artifacts below are implementation-ready specs, not yet deployed.

Date: 2026-04-15

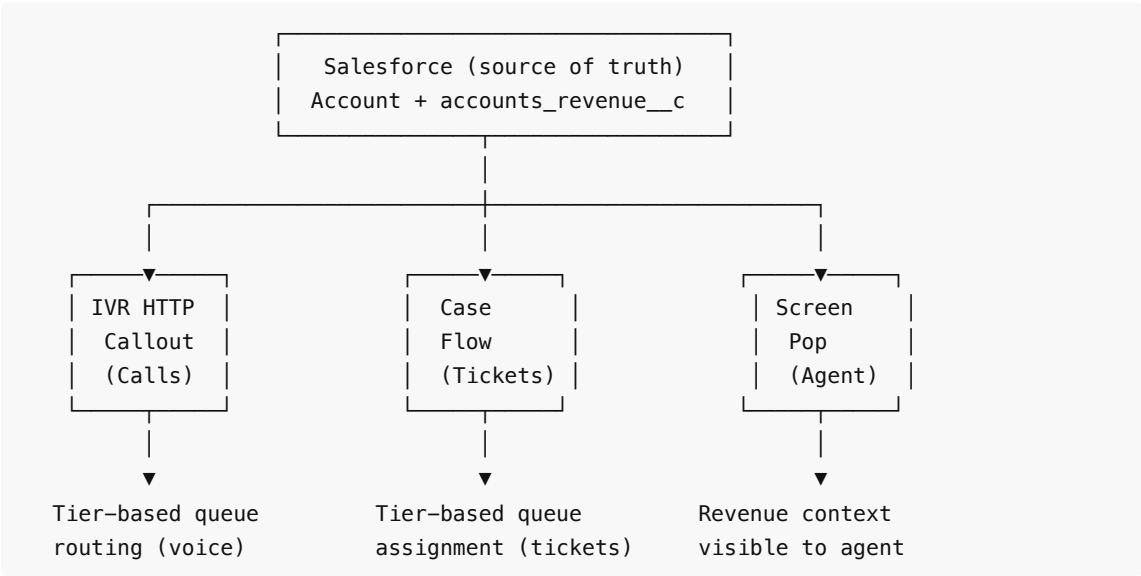

Problem

Today, inbound support calls and tickets are routed by queue rules that are blind to commercial context:

- An agent handling a `Top_Customer__c = true` strategic account sees the same screen as an agent handling a low-ARR ticket
- High-revenue customers can sit in a generic FLR queue behind smaller accounts
- CSMs are not surfaced to agents at first contact
- Hypercare accounts (escalated commercial situations) get no routing priority

All the source data exists in Salesforce — `Top_Customer__c` , `RAG__c` , `Is_SAAS_Premium_Account__c` , `Hypercare_active__c` , `accounts_revenue__c.Revenue_Booked_Amount__c` . The gap is purely integration and configuration.

Solution — Three Layers

Tier Model

Tier	Rule	Treatment
HYPERCARE	Hypercare_active__c = true AND Hypercare_End_Date__c >= TODAY	Dedicated Hypercare queue, senior agent, 2hr response SLA

STRATEGIC	Top_Customer__c = true OR Is_SAAS_Premium_Account__c = true	Strategic Support Queue, L2+, 4hr SLA
PREMIUM	SAAS_Enterprise_Account__c = true AND RAG__c IN ('GREEN', 'AMBER')	Premium Support Queue, L2 priority
STANDARD	Everything else	Default L1 → L2 flow

Tier is stamped on the Account as `Support_Tier__c` (formula field) and on the Case as `Account_Revenue_Tier__c` (stamped via Flow at creation).

Documents in This Package

#	Document	Audience	Purpose
01	Field Definitions & Phone Audit	SF Admin, Data team	New fields to create, data quality audit queries
02	Case Flow Specification	SF Admin, SF Developer	Before-Save Flow detailed spec with XML skeleton
03	IVR Nodeflow Design	ECC Admin, Exotel PS	HTTP callout + tier resolution + queue routing
04	Screen Pop & Layouts	SF Admin, ECC Admin	CTI softphone layout + Compact layout + conditional formatting
05	PS Engagement Brief	Exotel Professional Services	Formal brief to engage PS for IVR callout + queue config
06	Test & Rollout	QA, Support Ops	UAT test plan + rollout runbook + operational SOQL

Quick Stats (Scope Sizing)

Based on Ameyo Care volumes (YTD 2026 from CLAUDE.md audit):

- **Normal Support tickets:** 4,988 (core Ameyo Care)
- **Platform Support tickets:** 19,257 (largest volume)
- **CognoAI tickets:** 963
- **Total in-scope support tickets/year:** ~26,000

At ~100 tickets/day across all in-scope record types — well within Salesforce governor limits for Before-Save Flow + subqueries.

Account-side:

- Revenue tier distribution (to be measured via operational SOQL in doc 06) will tell us queue capacity requirements

Prerequisites & Dependencies

Must Exist Before Rollout

- 1. **Phone number data quality** — Account.Phone and Contact.Phone must be populated and normalized for ANI → Account matching to work. *This is the single biggest risk.* See [01](#).
- 2. **Salesforce Connected App** — OAuth 2.0 Client Credentials flow for IVR → SF authentication
- 3. **Revenue Tier field** — Support_Tier__c formula on Account
- 4. **New Case fields** — Account_Revenue_Tier__c , Account_RAG_at_Creation__c , Account_CSM_Name__c , Is_Top_Customer__c , Account_LTM_Revenue__c (optional)
- 5. **New ECC queues** — Hypercare, Strategic, Premium support queues with agent assignment

External Dependencies (PS / Infra)

- Exotel PS for IVR nodeflow HTTP action configuration
- Infra team for queue capacity sizing (if new queues exceed current channel allocation)

Known Gaps & Open Questions

Gap	Impact	Plan
Phone number data quality is unknown	Blocks call-channel tier lookup	Run audit queries in 01 , remediate before IVR config
Revenue tier thresholds not agreed	Tier assignment may not match business intent	Run tier distribution analysis in 06 , validate with Sales + CS leadership
Hypercare flag drift	Active flag may not align with end date — 2 fields, one source of truth	Nightly cleanup job OR treat end date as source of truth (see 02)
Multi-tenant accounts (Setup_Account, Parent_Account on Case)	A ticket may reference a child account with different tier than parent	Decide: use Account on Case, or walk up to Universal Account? See 02
Ticket created via email vs call	Email ticket has no ANI — tier from Account lookup via sender email domain	Flow handles this via Case.AccountId (already resolved by existing rules)

Success Metrics

To track post-rollout (target: +30 days, +90 days):

Metric	Baseline Source	Target
Strategic account avg response time	Case.First_Response_Time__c WHERE Account_Revenue_Tier__c = 'STRATEGIC'	Reduce by 50% vs pre-rollout
Strategic account FCR (First Call Resolution)	Case + Survey__c	Improve by 15%
Strategic/Premium tickets mis-routed to L1	Case.Queue__c transitions	< 5%

CSAT for Strategic accounts	Survey__c.Overall_Experience__c	+0.5 points
% calls with successful tier lookup	IVR log analysis	> 90%

Build Order

Week 1 → Phone audit + remediation + Support_Tier__c formula on Account
 Week 2 → New Case fields + Before-Save Flow (sandbox)
 Week 2 → Compact layout + Tier_Badge__c formula (quick visible win)
 Week 3 → Salesforce Connected App + IVR callout node (PS engagement kicks off)
 Week 4 → IVR nodeflow update + new queue config in ECC
 Week 4 → CTI softphone layout config
 Week 5 → UAT with L1/L2 agents across all tier scenarios
 Week 6 → Production rollout (staged: tickets first, then calls)

Staging tickets-first is deliberate: the Case Flow has zero ECC/IVR dependencies and delivers immediate agent-visible value. The call-channel leg requires PS engagement and phone data cleanup.

Owners

Area	Owner
Salesforce schema + Flow	SF Admin + SF Dev
ECC queue config + IVR nodeflow	ECC Admin + Exotel PS
Phone data cleanup	Data team + Support Ops
Tier threshold definition	Sales Ops + Customer Success leadership
Agent training + UAT	Support Ops + L1/L2/L3 leads
Success metrics tracking	Support Analytics
